

What is TensorFlow?

INTRODUCTION TO TENSORFLOW IN R

Colleen Bobbie
Instructor

A brief TensorFlow history

- created by the Google Brain team
- open source library that uses:
 - Python (and now R) as a front-end API
 - C++ for application execution
- particularly popular for:
 - digit classification
 - NLP
 - RNNs

Relax, don't be so tens(ors)

TensorFlow creates flow-through graphs which describe how data move through processing nodes.

Let's go through a dataflow graph for the following equation:

$$(A \times B) + C$$

Getting Started in R

To start your TensorFlow journey, you'll first need to install TensorFlow on your machine.

Once that is complete, you can load TensorFlow using:

```
library(tensorflow)
```

To call up your configuration details, use:

```
tf_config()
```

TensorFlow Sessions

To create any computations in TensorFlow, you must first launch a session.

To start a session:

```
firstsession = tf$Session()  
print(firstsession$run())
```

To complete a session:

```
firstsession$close()
```

Let's practice!

INTRODUCTION TO TENSORFLOW IN R

TensorFlow syntax, variables, and placeholders

TensorFlow constants

Constants are:

- well, constant
- create nodes whose values do not change

We can create constants using `tf.constant()`.

`tf.constant()` uses several basic parameters including:

- value
- dtype = `None`
- shape = `None`

TensorFlow constants

For example, in the last lesson we used:

```
HiThere <- tf$constant('Hi DataCamp Student!')
```

Another example:

```
a = tf$constant(2)
```

float32!

TensorFlow variables

- may change over the course of your session
- `tf$Variable('initial value', 'optional name')`

For example:

```
EmptyMatrix <- tf$Variable(tf$zeros(shape(4,3)))
```

where: `tf$zeros()` fills in the matrix with 4 rows and 3 columns of zeros.

| | | |
|---|---|---|
| 0 | 0 | 0 |
| 0 | 0 | 0 |
| 0 | 0 | 0 |
| 0 | 0 | 0 |

TensorFlow placeholders

- similar to variables, but will assign data at a later date
- used when we know the shape of the tensor, but will use data from a previous pipeline execution (or an external source)

```
tf$placeholder(dtype, shape = None, name = None)
```

For example:

To create a float32 placeholder, `SinglePlaceholder` :

```
SinglePlaceholder <- tf$placeholder(tf$float32)
```

Let's practice!

INTRODUCTION TO TENSORFLOW IN R

TensorBoard: visualizing TensorFlow models

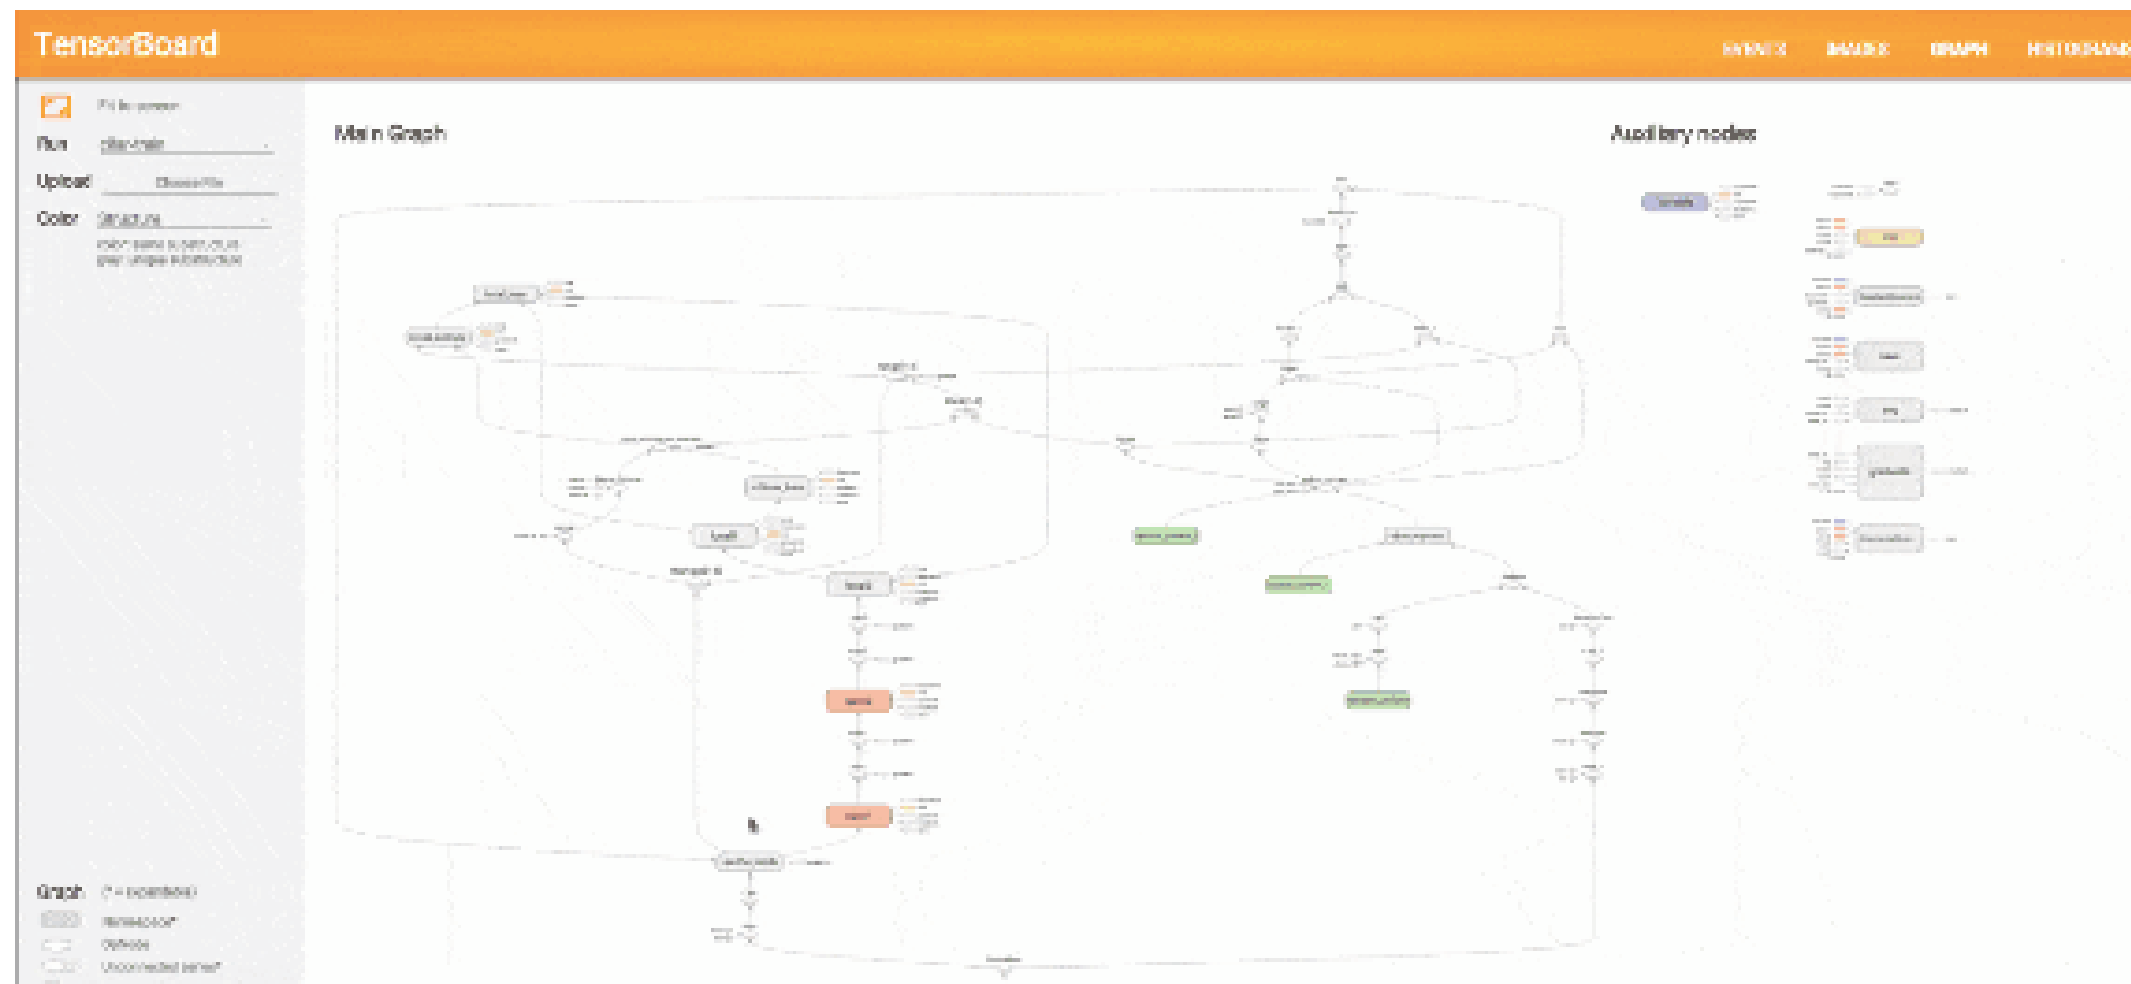

INTRODUCTION TO TENSORFLOW IN R

Visualizing models

- Problem: TensorFlow computations can become complicated quickly and can be difficult to debug
 - Solution: TensorBoard!

¹ GIF source: TensorFlow RStudio

Preparing your session for TensorBoard

1. Start your session

```
session <- tf$Session()
```

2. Record your variables/constants/placeholders and operations

```
a <- tf$constant(5, name = "NumAdults")  
b <- tf$constant(6, name = "NumChildren")  
c <- tf$add(a,b)  
print(session$run(c))
```

Opening your session in TensorBoard

3. Write your session to a location on your machine

```
writemygraph <- tf$summary$FileWriter('./graphs', session$graph)
```

4. Open TensorBoard to view the computational graph

```
tensorboard(log_dir = './graphs')
```

Visualizing your graph

The screenshot displays the TensorBoard web application. The top navigation bar is orange with the 'TensorBoard' logo and a 'GRAPHS' tab. On the left sidebar, there is a search bar with the placeholder text 'Search nodes. Regexes supported.' Below it are two icons: a window icon for 'Fit to Screen' and a download icon for 'Download PNG'. Further down, there is a 'Run (1)' dropdown menu showing 'graphs\'', a 'Session runs (0)' dropdown, an 'Upload' section with a 'Choose File' button, and a 'Trace inputs' toggle switch which is currently turned off. At the bottom of the sidebar is a legend section titled 'Graph (* = expandable)' with entries for 'Namespace*' and 'OpNode'. The main content area on the right is titled 'Main GraphAuxiliary Nodes' and shows a simple computational graph. This graph has two input nodes on the left labeled 'NumAdults' and 'NumChildren', which are connected by arrows to a single output node on the right labeled 'Add'.

Let's practice!
